

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

1. (Currently Amended) A computer system comprising:
a main system that executes an application in cooperation with a human user;
an auxiliary system to evaluate problems in the main system using a service module to collect problem related data from the main system, wherein the auxiliary system determines a context of the evaluated problems and distinguishes versions of the main system;
~~an acquisition module that acquires knowledge representations;~~
a knowledge module that stores the knowledge representations and distinguishes contexts that are predefined sets of knowledge representations; and
an inference module that processes problem related data with knowledge representations to identify solutions, wherein the inference module forwards the solutions through the service module to the main system.

2. (Previously Presented) The computer system of claim 1, wherein the auxiliary system distinguishes context and versions relating to the application.

3. (Previously Presented) The computer system of claim 2, wherein the auxiliary system distinguishes context and versions by using a check lexicon in the knowledge module.

4. (Previously Presented) The computer system of claim 3, wherein the check lexicon lists details for the knowledge representations, wherein the details depend on a version of the main system.

5. (Previously Presented) The computer system of claim 3, wherein the check lexicon lists details for the knowledge representations, wherein the details depend on a version of the application.

6. (Previously Presented) The computer system of claim 3, wherein the check lexicon lists details for the knowledge representations, wherein the details depend on the context of the problem.

7. (Previously Presented) The computer system of claim 3, wherein the check lexicon lists details for the knowledge representations that depend on a version of the main system.

8. (Previously Presented) The computer system of claim 3, wherein the check lexicon uses parameters for versions and context.

9. (Cancelled)

10. (Previously Presented) The computer system of claim 1, wherein the knowledge module distinguishes context with primary context and secondary context, wherein the secondary context is referenced from the primary context.

11. (Previously Presented) The computer system of claim 1, wherein the knowledge module makes knowledge representations selectively available or non-available according to a selected context.

12. (Currently Amended) An interface module with expertise functionality for evaluating problems in a main computer system that executes an application, wherein the inference module is adapted to process problem related data with knowledge representations to identify solutions and the inference module distinguishes problem related data in context classes, wherein the context classes are predefined sets of knowledge representations.
